Mr. McKenna,

We have completed the testing of the Schutt football helmets (all models) that you had treated with your Sports-O-Zone device. We found that there were no detrimental effects to the performance of the helmets. All of the helmets subjected to the Sports-O-Zone treatment passed all NOCSAE performance requirements. The individual components of the helmets were also tested to ascertain if any of the physical properties had been affected in any negative manner. All components tested were found to be unaffected by the treatment. The only component in all of the helmet models tested that showed any change at all, was the white urethane cover material of the DNA inflatable fit liner. The liner material exhibited a slight color change (slight yellowing), but was found to be fully functional, with no detriment to its performance.

Regards,

Larry E. Maddux
